

Abstract

orking checklists of the vertebrate animals occurring in Wisconsin are provided. Six hundred ninety-three species are documented from the state (159 fishes, 19 amphibians, 35 reptiles, 408 birds, and 72 mammals). Six hundred sixty-eight species are believed to be native, while 25 are introduced non-native species (14 fishes, 8 birds, and 3 mammals). Five species are listed at the federal level as endangered and 1 is listed as threatened. Thirty-one species are listed as endangered species at the state level and 28 are considered threatened. At least 12 species have been extirpated from the state (6 fishes, 2 birds, and 4 mammals). Special codes indicate the relative occurrence of each species in the bird checklist. It is suggested that a process be initiated to periodically update the checklists.

Checklists of WISCONSIN VERTEBRATES

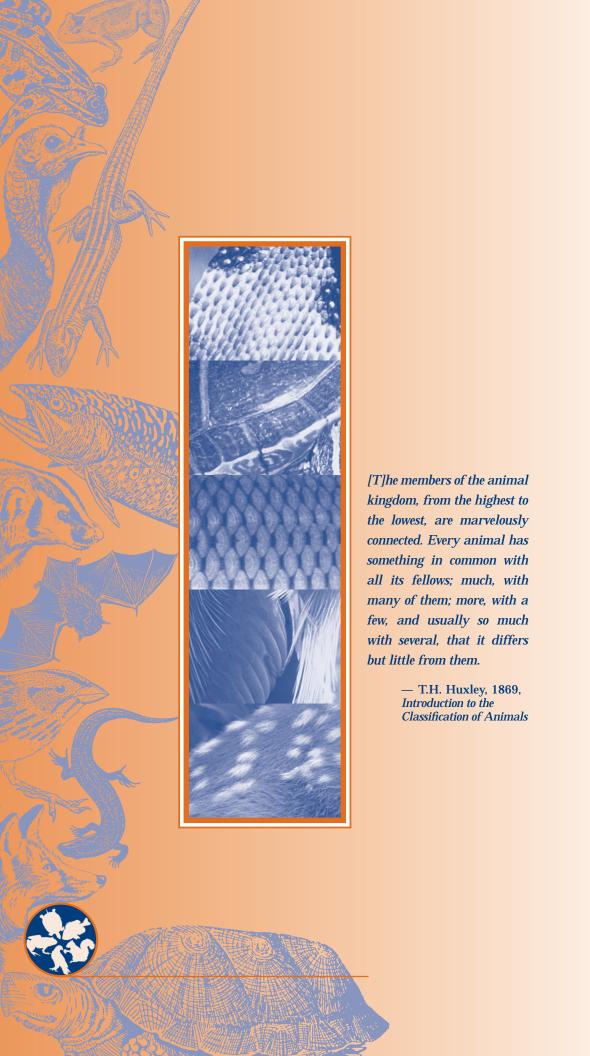

Dreux J. Watermolen and Matthew D. Murrell

Bureau of Integrated Science Services

Wisconsin Department of Natural Resources P.O. Box 7921 Madison, WI 53707-7921

2001

INTRODUCTION

he vertebrates (fishes, amphibians, reptiles, birds, and mammals) are some of the most well studied and best known components of Wisconsin's fauna. Each taxonomic class has been treated in a major monographic study of the state's fauna (Becker 1983, Vogt 1981, Robbins 1991, Jackson 1961). These references are now more than a decade old, however, and scientists have made numerous taxonomic name changes in the intervening years. In addition, a number of non-native (exotic) species have been introduced to the state and now occur as naturally reproducing populations. Lyons, *et al.* (2000) recently updated the checklist of Wisconsin fishes, and the Wisconsin Society for Ornithology (WSO) currently maintains a bird checklist on its web site (http://www.uwgb.edu/birds/wso/). Yet, there has been no comprehensive up-to-date reference available for all vertebrate species occurring in Wisconsin.

Such standardized checklists provide a ready reference for many scientific endeavors, both in the field and in the laboratory, and are particularly useful to students (Jones, *et al.* 1992; Jones, *et al.* 1997). In this report, we provide checklists of all known Recent wild — naturally occurring and introduced — vertebrates found in the state. With the exception of the birds, no distinction is made between resident and migrant species or between those that occur regularly and those of casual or accidental occurrence. Zoo and game farm populations are not listed, nor are unestablished escapees from such populations. Doubtful records, exclusions of species from the checklists, and extinct species are discussed in the text preceding each checklist. Six hundred ninety-three vertebrate species are documented as occurring in the state (159 fishes, 19 amphibians, 35 reptiles, 408 birds, and 72 mammals).

The checklists include scientific and common names of individual taxa from order to species. Complete scientific names include the name of the author who initially described the species and the year of publication. We leave author names and publication dates out of our checklists for the sake of clarity and ease of use. We encourage readers with a need for full citations to consult the most recent edition of the standard scientific references cited in the text preceding each checklist. A single common name is provided for each species to promote uniformity and more precise communication. These are generally selected from standardized lists of common names. At the family and order levels, where we take some liberties with nomenclature, more than one common name may be given. This indicates content rather than alternative names for the group. Capitalization of common names follows ornithological convention, and we carry this practice throughout the entire manuscript for the sake of consistency. We recognize that not everyone will be pleased with this decision. Authors using common names should consult the appropriate style guide or author instructions to determine the accepted practice when preparing manuscripts for submission and publication.

Information on the geographic distribution, biology, ecology, and natural history of the individual species is beyond the scope of this work. We describe, however, several on-going monitoring and atlas programs and briefly discuss the literature pertaining to Wisconsin vertebrates, as both seem relevant to a checklist endeavor. The "primary references" listed at the end of each checklist provide access to additional information on species found in the state. Hay, *et al.* (1997) provide status information for species listed as endangered or threatened by the State of Wisconsin.

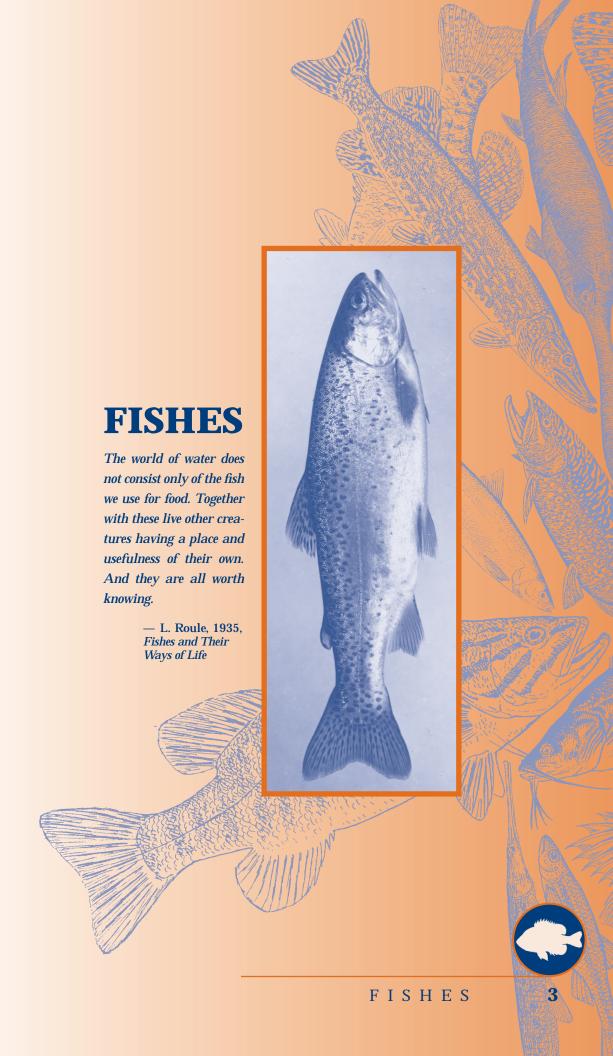

The following codes are used in all five checklists to indicate the conservation status of the various species:

- **federally endangered** under federal law, any animal or plant in danger of extinction within the foreseeable future throughout all or a significant portion of its range (50 CFR § 17.3).
- **federally threatened** under federal law, any animal or plant likely to become endangered within the foreseeable future throughout all or a significant portion of its range (50 CFR § 17.3).
- **state endangered** under state law, any species whose continued existence as a viable component of this state's wild animals or wild plants is determined by the DNR to be in jeopardy on the basis of scientific evidence (§ 29.604(2)(a), *Wis. Stats.*).
- **state threatened** under state law, any species of wild animals or wild plants which appears likely, within the foreseeable future, on the basis of scientific evidence to become endangered (§ 29.604(2)(b), *Wis. Stats.*).
- **introduced** a non-indigenous/non-native species introduced, either intentionally or unintentionally, into an area (in this case Wisconsin) that is not part of its natural range.
- **extirpated** a species that once occurred naturally within the state's boundary but no longer does even though it may occur elsewhere.

Of the 693 species included in the checklists, 5 are listed at the federal level as endangered and 1 is listed as threatened. Thirty-one species are listed as endangered species at the state level and 28 are considered threatened. Six hundred sixty-eight species are believed to be native, while 25 are introduced non-native species (14 fishes, 8 birds, and 3 mammals). At least 12 species have been extirpated from the state, including 6 fishes (2 are now extinct), 2 birds (both are now extinct), and 4 mammals. We use additional codes to indicate the relative occurrence of species in the bird checklist. These are identified and defined in the text preceding that checklist.

Because knowledge of the systematic relationships of animals is always changing and additional species are being added to the list of Wisconsin's fauna, it is likely that these lists will be out-of-date in a relatively short time. Therefore, these lists should be considered working lists. It will be necessary to initiate a process to issue periodic updates.

The DNR web site includes an electronic version of this document (http://www.dnr.state.wi.us/).

FISHES

yons, *et al.* (2000) recently published an updated checklist, along with information on the occurrence, taxonomic status, distribution, and abundance of fishes in Wisconsin. We adapted that work and reproduce it here. Species-level taxonomy in the checklist follows that in the fifth edition of *Common and Scientific Names of Fishes from the United States and Canada* published by the American Fisheries Society (Robins, *et al.* 1991). This list will be updated soon and may include scientific name changes for several Wisconsin species to match names proposed by Mayden, *et al.* (1992). We show these likely changes in parentheses in the checklist. Higher level taxonomy (orders and families) follows Nelson (1994), with the exception of the Cottidae (sculpins) which are placed in the order Perciformes consistent with Mooi and Gill (1995). Species are listed alphabetically under each family. Hybrids are not included. Common names follow Robins, *et al.* (1991).

The final revision of the Wisconsin checklist contains 159 fish species in 27 families. One hundred forty-five are native to the state. Fourteen are introduced non-native species. No Wisconsin fishes are listed as endangered or threatened at the federal level. Ten fish species are listed as endangered at the state level and 11 species are considered threatened at the state level.

Excluded Fish Species

We exclude several fish species from our checklist. Lyons, *et al.* (2000) categorized 19 non-native fish species as "transient" because self-sustaining populations of these species have not been found within the state. These hypothetical species (Table 1) are excluded from our checklist, since they do not meet our criteria for inclusion.

Table 1. Transient non-native fish species excluded from the checklist.

Alosa sapidissima	. American Shad
Ctenopharyngodon idella	. Grass Carp
Cyprinella lutrensis	Red Shiner
Epalzeorhynchus frenatum

Gambusia affinis	
Poecilia reticulata	. Guppy
Morone saxatilis	
Astronotus ocellatus	
Tilapia or Oreochromis sp	. "Tilapia" 🎢 🔣
•	- #// E X

In addition, Becker (1983) listed Longjaw Cisco (*Coregonus alpenae*) as occurring in the state. This species is now considered a synonym of the Shortjaw Cisco (*Coregonus zenithicus*) and is therefore excluded from the checklist.

Extinct Fish Species

In addition to the above listed species, we exclude the Deepwater Cisco (*Coregonus johannae*) and Shortnose Cisco (*C. reighardi*) from our list. Both species occurred in Lake Michigan, but are now believed to be extinct (Page and Burr 1991, Robins, *et al.* 1991, Coon 1999).

The Wisconsin Ichthyological Literature

The literature dealing with the life history, ecology, distribution, status and biology of Wisconsin fishes is extensive. Material has been published in a variety of ichthyology, ecology, zoology and fisheries management periodicals, as well as in numerous government reports. Most significant older works are included in the bibliography in Dr. George Becker's (1983) *Fishes of Wisconsin*. However, there has been no published bibliography of works dealing with Wisconsin fishes since Becker's work. Such a tool would be useful to professional fisheries managers, biologists, anglers and others interested in Wisconsin fishes. A considerable amount of biological information is also contained in unpublished agency records and files. Dr. John Lyons and colleagues have initiated work to update and rewrite *Fishes of Wisconsin* (J. Lyons, pers. comm.), and that work will likely bring the bibliography up to date.

Fish Survey and Atlas Efforts

In the mid-1970s, a research effort was initiated by the Wisconsin Department of Natural Resources (DNR) to systematically sample the distribution and relative abundances of fishes throughout the inland waters of Wisconsin. The study focused primarily on a survey of then current fish distribution, but also synthesized historical distribution records where these were available (Fago 1992). Reduced funding terminated the study in the 1980s before the entire state could be surveyed. Findings from the initial work are summarized in Fago (1992) and a number of previous basin-specific reports referenced therein. Voucher specimens from this study are maintained in the Milwaukee Public Museum's vertebrate zoology collection. No systematic statewide inventory has occurred since the Fish Distribution Survey was terminated. However, many additional fisheries studies have been carried out, including studies of entire fish communities in certain habitat types and detailed surveys of all habitats within specific regions. Lyons, et al. (2000) identify these more recent studies. Systematic statewide surveys for specific species (e.g., several lampreys, minnows, suckers, and darters; Paddlefish; Slender Madtom; Slimy Sculpin; and Longear Sunfish) have also been conducted (J. Lyons, pers. comm.).

While native in the Mississippi River basin, the catadromous American Eel (Anguilla rostrata) is an introduced species in Wisconsin waters of the Great Lakes. Although some individuals may swim all the way from the Atlantic Ocean to Lake Superior, natural barriers precluded this in historical times. In addition, it is likely that individuals of this species arrive in the ballast water of ocean-going vessels.

Primary Fish References: Lyons, *et al.* 2000, Coon 1999, Fago 1992, Page and Burr 1991, Holland-Bartels, *et al.* 1990, Becker 1983, Auer 1982, Eddy and Underhill 1974, Smith, *et al.* 1971.

AMPHIBIANS

Because most amphibians are secretive animals hidden away in their moisture-conserving crevices and lairs, commonly seen and heard only during breeding season, little is popularly known of their natural ways.

— S. Klein, 1983, The Encyclopedia of North American Wildlife

AMPHIBIANS

axonomy in the amphibian checklist closely follows the standard field guide to eastern and central North American species by Conant and Collins (1991) and *Salamanders of the United States and Canada* (Petranka 1998). Species are listed alphabetically under each family. In some cases, a subspecies is designated. We followed this practice only when a single subspecies is known from the state and there is no question as to its identity. Common names follow Crother, *et al.* (2000).

The final revision of the checklist contains 19 amphibian species in 7 families. All 19 species are native. No Wisconsin amphibians are listed as endangered or threatened at the federal level. Blanchard's Cricket Frog (*Acris crepitans blanchardi*) is listed as endangered at the state level. No amphibians are listed as threatened at the state level.

Excluded Amphibian Species

We exclude Tremblay's Salamander (*Ambystoma tremblayi*) from the checklist. Vogt (1981) included an account for Tremblay's Salamander in his treatment of the Wisconsin herpetofauna, but this "species" is now known to be a triploid, unisexual variety of hybrid origin (between Jefferson's Salamander [*Ambystoma jeffersonianum*] and Blue-spotted Salamander [*Ambystoma laterale*]).

The Wisconsin Herpetological Literature

The literature dealing with the ecology, life history, status, history and distribution of Wisconsin's amphibians is scattered in a plethora of journals, bulletins, and sometimes-obscure reports. Extensive bibliographies providing access to this literature have been compiled (Dlutkowski, *et al.* 1987, Watermolen 1992), and a comprehensive bibliography is now available on the Milwaukee Public Museum's web site (http://www.mpm.edu/). Updating this bibliography is an on-going cooperative project.

Amphibian Survey and Atlas Efforts

Amphibians are the subjects of several on-going survey and atlas efforts. The *Wisconsin Herpetological Atlas Project* tracks the distributions of amphibians (and reptiles) in Wisconsin. The Milwaukee Public Museum, with the cooperative support of the DNR's Bureau of Endangered Resources, and The Nature Conservancy, initiated the Herpetological Atlas Project in 1986. The Herpetological Atlas is producing a computerized database of amphibian distribution, based on records obtained from museum collections, field surveys, literature, and field notes provided by volunteer observers throughout the state. Over 30,000 records have been received, and over 450 new county records have been confirmed since the project began. The data collected help in mapping species distributions, documenting rare species occurrences, analyzing population trends, examining habitat requirements, and planning

conservation priorities. Preliminary results of the Herpetological Atlas Project are presented in Casper (1996, 1998). For more information on the Herpetological Atlas Project, readers are encouraged to visit the project's web site (http://www.mpm.edu/).

The Wisconsin Frog and Toad Survey is an on-going survey coordinated by the DNR. The survey was initiated in 1984, and relies heavily on volunteer efforts. Background information on the survey is included in Mossman and Hine (1985), and the history, analytical techniques, distribution maps, and trend results through 1995 are thoroughly summarized in Mossman, et al. (1998). Survey routes are distributed statewide, with a goal of two survey routes in each county. Routes consist of 10 sites that are monitored 3 times annually (8-30 April, 20 May - 5 June, and 1-15 July). Presence/absence of each species is determined for each site based on the breeding calls of male frogs. The relative number of calling individuals at each site ranks the abundance of each species. Survey data are statistically analyzed and a calling index to the route populations is calculated. These route populations are regressed over years to create a species population trend (Dhuey and Hay 1999).

Class Amphibia: Amphibians

Hemidactylium scutatum Four-toed Salamander

Plethodon cinereus Eastern Red-backed Salamander

Order Anura: Frogs

Family Bufonidae: Toads

Bufo americanus americanus Eastern American Toad

Family Hylidae: Treefrogs

SE Acris crepitans blanchardi Blanchard's Cricket Frog Pseudacris crucifer crucifer Northern Spring Peeper

*Pseudacris triseriata*⁷ Chorus Frog

Hyla chrysoscelis Cope's Gray Treefrog

Hyla versicolor Gray Treefrog

⁷ Elevation of the Western Chorus Frog (*P. t. triseriata*) and Boreal Chorus Frog (*P. t. maculata*) subspecies to full species status was proposed by Platz (1989). Both subspecies apparently occur in Wisconsin, but their ranges have not been well defined. Until additional work has been completed to clarify the identity of Wisconsin specimens, we have chosen to treat the two as subspecies of the Chorus Frog.

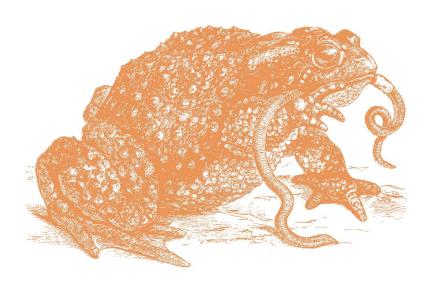

Family Ranidae: Ranids ("true" frogs)

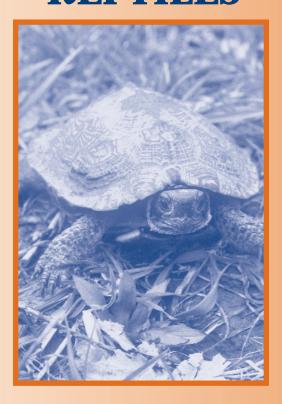

Rana catesbeiana American Bullfrog Rana clamitans melanota Northern Green Frog

Rana palustris Pickerel Frog

Primary Amphibian References: Casper 1998, Mossman, et al. 1998, Casper 1996, Watermolen 1995, Conant and Collins 1991, Vogt 1981, Pentecost and Vogt 1976 (as well as references cited in Watermolen 1992 and Dlutkowski, et al. 1987).

REPTILES

Although reptiles are classified among the higher vertebrates, the form of many of them is so reminiscent of life on Earth hundreds of millions of years ago that they may justifiably be regarded as living relics of those times...

— Z. Vogel Reptile Life

REPTILES

axonomy in the reptile checklist follows that in the field guide to eastern and central North American species by Conant and Collins (1991). Species are listed alphabetically under each family. As in the amphibian checklist, specific subspecies are occasionally listed. We followed this practice when only one subspecies is known from the state and there is no question as to its identity. Common names follow Crother, *et al.* (2000).

The final revision of the Wisconsin checklist contains 35 reptile species in 9 families. All 35 species are native. None are currently listed as endangered or threatened at the federal level. One turtle, 1 lizard, and 4 snakes are listed as endangered at the state level, and 2 turtles and 1 snake are considered threatened at the state level.

Excluded Reptile Species

We exclude Plains Hognose Snake (*Heterodon nasicus nasicus*) and Smooth Earth Snake (*Virginia valeriae*) from the Wisconsin checklist. These species are known from Wisconsin from only one or two specimens (Vogt 1981, Casper 1996). Most herpetologists believe it is doubtful that these species occur in breeding populations anywhere in the state, and their occurrence can be considered accidental.

The Wisconsin Herpetological Literature

The literature on Wisconsin's reptiles is extensive and rich; records have been published in a variety of journals, bulletins, and other outlets. Dlutkowski, *et al.* (1987) provided a bibliography of 360 papers, notes and articles dealing with the ecology, life history, distribution, history, and status of Wisconsin amphibians and reptiles. More than 140 additional works are included in an update to that bibliography (Watermolen 1992). An on-line version of the bibliography is now available on the Milwaukee Public Museum's web site (http://www.mpm.edu/). Update of the bibliography is an on-going cooperative project.

Reptile Survey and Atlas Efforts

The Wisconsin Herpetological Atlas Project tracks the distributions of reptiles (and amphibians) in Wisconsin. The Milwaukee Public Museum, Inc. with the cooperative support of the DNR's Bureau of Endangered Resources and the Nature Conservancy initiated the Herpetological Atlas Project in 1986. The Herpetological Atlas is producing a computerized database of reptile distribution, based on records obtained from museum collections, field surveys, literature, and field notes provided by volunteer observers throughout the state. Over 800 endangered and threatened species records have been received, and over 450 new county records have been confirmed since the project began. The data collected help in mapping species distributions, documenting rare species occurrences, analyzing population trends, examining habitat requirements, and planning conservation priorities. Preliminary results of the Herpetological

Atlas Project are presented in Casper (1996, 1998). For more information on the Herpetological Atlas Project, readers are encouraged to visit the project's web site (http://www.mpm.edu/).

Suborder Serpentes: Snakes

Family Colubridae: Colubrids

Carphophis vermisWestern WormsnakeColuber constrictor9Eastern RacerDiadophis punctatusRing-necked SnakeElaphe obsoleta obsoletaBlack Ratsnake

⁹ Wisconsin populations of this species have typically been classified as the Blue Racer (*Coluber constrictor foxi*), but Oldfield and Moriarty's (1995) recent classification of Minnesota specimens as Eastern Yellow-bellied Racer (*C. c. flaviventris*) calls this designation into question (Casper 1996). Additional work with Wisconsin specimens is needed in order to assign the correct subspecies. The recently adopted regulations covering reptiles (NR 19.26, Wis. Admin. Code) refer to Racers (*C. constrictor*).

⁸ The two species of *Graptemys, ouachitensis* and *pseudogeographica*, were previously considered subspecies of *G. pseudogeographica*, but are given full species status by Vogt (1980, 1993). While some authorities (e.g., Ernst and Barbour 1989, Ernst, *et al.* 1994) agree that the two taxa merit species status, other herpetologists (e.g., Conant and Collins 1991) have not yet embraced this change. We think the evidence is compelling and treat *ouachitensis* and *pseudogeographica* as separate species.

Family Colubridae: Colubrids (continued)
Elaphe vulpina

Thamnophis sirtalis Common Gartersnake
Family Viperidae: Pit Vipers
Crotalus horridus Timber Rattlesnake
SE Sistrurus catenatus catenatus Eastern Massasauga

¹⁰ The taxonomy of this species remains confusing. Collins (1990) uses the species name *catenifer*. While some authorities (e.g., Oldfield and Moriarty 1995) have chosen to follow this convention in an attempt to maintain consistency, others (e.g., Casper 1996, Conant and Collins 1991) have retained *melanoleucus*. The recently adopted regulations covering reptiles (NR 19.26, Wis. Admin. Code) refer to Bullsnakes (*P. melanoleucus sayi*). Crother, *et al.* (2000) use *P. c. sayi*.

Primary Reptile References: Christophel, *et al.* 2000, Casper 1996, Conant and Collins 1991, Vogt 1981, Pentecost and Vogt 1976 (as well as references cited in Watermolen 1992 and Dlutkowski, *et al.* 1987).

BIRDS

For those lucky people who have discovered the world of birds around us, life is never dull. Everywhere outdoors — from just outside our windows to the farthest wilderness — hundreds of kinds of colorful, tuneful birds are leading fascinating lives.

— Kenn Kaufman, 1996, Lives of North American Birds

BIRDS

American Ornithologists' Union's *Check-list of North American Birds* (AOU 1998). The initial state checklist was prepared from *Wisconsin Birdlife* (Robbins 1991). Gerald Bartelt and Amber Roth (DNR Bureau of Integrated Science Services) provided us with updated occurrence and status information. We also consulted the "official state checklist" of the Wisconsin Society for Ornithology (WSO), as published on the organization's web site (http://www.uwgb.edu/birds/wso/), and the reports of Tessen (1989), Robbins, *et al.* (1996) and Temple, *et al.* (1997), as well as records published in the *Passenger Pigeon* through 1999 (vol. 61). Common names follow the AOU (1998) checklist, except in a few cases where we deviate from that checklist and provide what we feel are more descriptive names for orders or families.

Four hundred eight bird species in 56 families are included in the Wisconsin checklist. Four hundred are native to the state and 8 are introduced non-native species. Piping Plover (*Charadrius melodus*), Whooping Crane (*Grus americana*), and Kirtland's Warbler (*Dendroica kirtlandii*) are listed as endangered species at the federal level. Thirteen bird species are listed as endangered at the state level and 13 others are considered threatened at the state level.

In addition to the standard conservation status codes used in the other checklists in this report (see page 2), we indicate the relative occurrence of all listed bird species. There are a variety of ways in which such information can be categorized, each with its own inherent strengths and weaknesses. Recognizing that not everyone will be pleased with our approach or agree with all of our designations, we indicate the relative occurrence of species using the following codes:

- **accidental** a species whose presence in the state is documented by generally fewer than 3 records and/or that remains questionable as a component of the Wisconsin fauna.
- **R** rare a species reported from Wisconsin eight or fewer times annually.
- **© casual** a species reported from Wisconsin only once every 3-5 years.
- migrant a species that does not breed in Wisconsin, but which is seen during spring/autumn migration periods or during the winter.

Unless designated otherwise (i.e. as \triangle or \bigcirc), species can be considered breeding birds of the state. Bird species designated as rare (\bigcirc) are generally migratory species, but there are a handful of rare breeding birds as well. In addition, Robbins, *et al.* (1996) list 233 breeding species from the state based on evidence of breeding between 1966 and 1991.

Excluded Bird Species

We exclude 15 species, considered species of hypothetical status, from the checklist. Robbins (1991) also considers most of these species to be hypothetical.

Table 2. Bird species of hypothetical status excluded from the checklist.

Aechmophorus clarkii	. Clark's Grebe
Eudocimus albus	. White Ibis
Falco mexicanus	. Prairie Falcon
Laterallus jamaicensis	. Black Rail
Tringa erythropus	. Spotted Redshank
Sterna dougallii	. Roseate Tern
Brachyramphus perdix	Long-billed Murrelet
Zenaida asiatica	White-winged Dove
Archilochus colubris	Black-chinned Hummingbird
Pyrocephalus rubinus	
Tyrannus vociferans	. Cassin's Kingbird
Oenanthe oenanthe	. Northern Wheatear
Anthus spragueii	. Sprague's Pipit
Myioborus pictus	Painted Redstart
Carduelis psaltria	Lesser Goldfinch

Some biologists consider Roseate Spoonbill (*Ajaia ajaja*), Masked Duck (*Nomonyx dominicus*), Willow Ptarmigan (*Lagopus lagopus*), Eskimo Curlew (*Numenius borealis*), White-winged Tern (*Chlidonias leucopterus*), and Say's Phoebe (*Sayornia saya*) to be extirpated from Wisconsin. We include these species in the checklist as "accidental," because we feel the available records more closely fit this category. It should be recognized, however, that all records of these species occurring in the state are from the 1800s.

Extinct Bird Species

We exclude Carolina Parakeet (*Conuropsis carolinesis*) and Passenger Pigeon (*Ectopistes migratorius*) from the checklist because both species are now extinct.

The Wisconsin Ornithological Literature

The literature dealing with the life history, ecology, distribution, status, phenology, and biology of Wisconsin birds is extensive. Papers and notes have been published in a wide variety of ornithology, ecology, zoology and wildlife management outlets, as well as numerous government agency reports. The Wisconsin Society for Ornithology publishes a quarterly journal, *The Passenger Pigeon*, focusing exclusively on Wisconsin birds. Much of the Wisconsin ornithological literature is cataloged in Robbins' (1991) *Wisconsin Birdlife*. However, no comprehensive bibliography of more recent works dealing with Wisconsin birds has been compiled.

Bird Survey and Atlas Efforts

The Wisconsin Breeding Bird Atlas (WBBA) is an on-going project administered by the Wisconsin Society for Ornithology (WSO). The WBBA began in the spring of 1995. The WBBA provides a permanent record of the bird species breeding in the state, increases our knowledge of the distribution, nesting phenology, habitat preferences, and abundance of Wisconsin breeding birds, and provides baseline data for monitoring future changes in bird populations. WBBA data also can be used to provide comparisons with historical studies, complement existing or on-going avian monitoring programs in Wisconsin and in nearby states, and assist international efforts to preserve Neotropical migratory birds. Information about the WBBA and the results of atlas efforts can be viewed at the project's web site (http://www.uwgb.edu/birds/wbba/).

The Wisconsin Checklist Project began in 1982 under the direction of Dr. Stanley Temple, with sponsorship from the WSO, and has been administered by the DNR since 1989. The project relies on simple checklist information provided by volunteer bird watchers. Participants submit weekly checklists of the birds they encountered in their respective regions of the state. From these records, reporting frequencies are calculated – i.e. the percentage of the weekly checklists on which the species has been reported during a particular period of time and in a particular region of the state (Temple, et al. 1997). These reporting frequencies form the basis for seasonal, geographical, and historical analyses of the distribution and abundances of bird populations in Wisconsin. Data from the first five years of the project are summarized in Temple and Cary (1987) and for the first 14 years in Temple, et al. (1997).

Staff members in the DNR's Bureaus of Endangered Resources, Integrated Science Services, and Wildlife Management conduct a number of recurrent Wildlife Surveys. These surveys generally include population status information, harvest summaries, population analyses, and hunter surveys, as well as analysis of wildlife damage claims and nuisance complaints. Semiannual Wildlife Survey Reports are prepared for each survey effort and are distributed to managers, researchers, administrators, and other DNR employees. Wildlife Survey Reports are intended to provide current survey information for management decisions. Thus, these reports provide current data and enough interpretation to understand the results (i.e. they are not intended to be definitive analyses of all survey data that has been collected). The surveys and the resulting reports allow the DNR to use the most current information to manage birds, including establishing harvest limits and seasons that are scientifically defensible. Through these surveys, the DNR has obtained a considerable amount of information on waterfowl, upland game birds, and a variety of endangered and threatened species. The DNR has also conducted breeding bird surveys on state natural areas, and now includes bird survey work as part of the master planning process for its larger properties.

In addition to these statewide efforts, there are several broader efforts that gather data on Wisconsin birds. The *North American Breeding Bird Survey* (BBS) is a large-scale roadside survey, primarily covering the

continental United States and southern Canada, although survey routes have recently been initiated in Alaska and northern Mexico. The BBS was started in 1966, and the over 3,500 routes are surveyed by experienced birders each June. The primary objective of the BBS has been the estimation of population change for songbirds. However, the data have many potential uses, and investigators have used the data to address a variety of research and management objectives. Results are summarized on the BBS web site, where they are supplemented with pictures of birds and other species information (http://www.mbr-pwrc.usgs.gov/bbs/bbs.html).

The National Audubon Society's *Christmas Bird Count* (CBC) is an early-winter survey of birds. Initiated in 1900, the CBC occurs throughout North America. The sample area for a count is a circle 15 miles in diameter. Varying numbers of volunteers count all birds they see within the circle during a single day, within approximately 2 weeks of 25 December. The CBC is available by order from the National Audubon Society or from the BirdSource web site (see below) For additional information on the CBC, refer to the CBC web site (http://www.mbr-pwrc.usgs.gov/bbs/cbc.html).

BirdSource is an interactive on-line information system designed and managed by the National Audubon Society and the Cornell Laboratory of Ornithology. Citizen participants record and share bird counts. Their data help define bird ranges, populations, migration pathways, and habitat needs. BirdSource uses contributed data to track and display the density and movement of birds similar to how meteorologists track the weather. More information can be found on the BirdSource web site (http://www.birdsource.org/).

BIRDS

MAMMALS

It would be correct to say that mammals are a group of animals with backbones, whose bodies are insulated by hair, which nurse their infants with milk, and which share a unique jaw articulation. This, however, fails to convey how these few shared characteristics underpin the evolution of a group with astonishingly intricate adaptations, thrilling behavior, and highly complex societies.

— David Macdonald, 1984, The Encyclopedia of Mammals

MAMMALS

axonomy in the mammal checklist follows that in the *Revised Checklist of North American Mammals North of Mexico, 1997* published by the Museum of Texas Tech University (Jones, *et al.* 1997), *The Smithsonian Book of North American Mammals* (Wilson and Ruff 1999), and *Mammals of North America: Temperate and Arctic Regions* (Forsyth 1999). Species are listed alphabetically under each family. Common names follow Jones, *et al.* (1997) and Wilson and Cole (2000). Where Jones, *et al.* (1997) provide more than one common name, we select the one in most frequent use in Wisconsin. We deviate from Jones, *et al.* (1997) and Wilson and Cole (2000) in providing what we feel are more descriptive or appropriate common names for some families and orders (e.g., Mephitidae).

The final revision of the mammal checklist contains 72 species in 19 families. Sixty-nine mammal species are native to the state and 3 are introduced non-native species. The Indiana Bat (*Myotis sodalis*) and Gray Wolf (*Canis lupus*) are currently listed as endangered species at the federal level. The Canada Lynx (*Lynx canadensis*) is listed as a threatened species at the federal level. The American Martin (*Martes americana*) is listed as endangered, and the Gray Wolf as threatened, at the state level. Four mammal species are considered extirpated.

Excluded Mammal Species

We exclude three mammal species from our checklist. Two specimens of what are believed to be Northern Bog Lemmings (Synaptomys borealis) were recently caught by a biologist working for the Bad River Tribe (R. Bautz, pers. comm.). These have yet to be evaluated by a qualified mammalogist. Until a species determination is made, we are compelled to leave this species off the list. We also exclude the Evening Bat (Nycticeius humeralis). Jones and Birney (1988) depict the range of this species as reaching extreme southern Wisconsin. This appears to be an artifact of their mapping technique, as no specimens of Evening Bat have been obtained in Wisconsin. Future survey work may show these two species to be a part of the Wisconsin fauna. In addition, there is a single record of a Black-tailed Prairie Dog (Cynomys ludovicianus) living for several years in a farm field near Ferryville in Crawford County (Craven 1995). This individual was probably accidentally transported to the state in a load of hay brought from the Dakotas. The Prairie Dog is native to the Great Plains and its natural range extends no further west than western Nebraska, South Dakota and North Dakota (Jones, et al. 1985). It is unlikely that this species will become established as part of the state's fauna.

The Wisconsin Mammal Literature

The literature on Wisconsin mammals is extensive. Papers and notes have been published in a wide variety of mammalogy, ecology, zoology, and wildlife management periodicals, as well as in numerous government reports. Most significant works dealing with life history, ecology,

distribution and status published prior to 1960 are included in the bibliography in Jackson's (1961) *Mammals of Wisconsin*. No comprehensive bibliography of works dealing with Wisconsin mammals has been compiled since, although an attempt was made to catalog works dealing with Wisconsin Mustelidae and Mephitidae (Watermolen 1990).

Mammal Survey and Atlas Efforts

Staff members in the DNR's Bureaus of Endangered Resources, Integrated Science Services, and Wildlife Management conduct a number of recurrent *Wildlife Surveys*. These surveys focus primarily on population status information, harvest summaries, population analyses, hunter/trapper surveys, and winter track counts, as well as analysis of wildlife damage claims and nuisance complaints. Semi-annual *Wildlife Survey Reports* are prepared for each survey effort and are distributed to managers, researchers, administrators, and other DNR employees. These reports provide current survey information for management decisions and allow the DNR to manage mammals using the most current information, including establishing harvest limits and seasons that are scientifically defensible. The DNR has obtained considerable information on furbearers, small game species, large game species, and a variety of non-game species through these surveys.

The DNR also tracks regularly *Rare Mammal Observations*. Observations of American Marten (*Martes americana*), Gray Wolf (*Canis lupus*), Canada Lynx (*Lynx canadensis*), Mountain Lion (*Puma concolor*), and Moose (*Alces alces*) come from DNR field personnel, personnel in other resource agencies, and members of the general public. Observations are reported on "Rare Mammal Observation Cards," classified as "probable," "possible," or "not likely," and tabulated and summarized on an annual basis (e.g., Wydeven and Megown 1996, Wydeven and Cervantes 1997, Wydeven and Boles 1998). The status of each of these species is briefly discussed below.

American Marten occurred in most forested areas of Wisconsin until the mid-1800s (Endangered Species Committee 1973), but unregulated trapping for the fur trade and habitat changes led to their extirpation in the 1920s (Kohn and Eckstein 1987). American Marten were first protected in 1921 and have been listed as a state endangered species since 1972. Martens were reintroduced into the Nicolet National Forest in northeastern Wisconsin between 1975 and 1982, and into the Chequamegon National Forest in northwestern Wisconsin between 1987 and 1990. Recent surveys suggest American Marten are doing well in the Nicolet National Forest and possibly expanding their range. American Marten do not, however, seem to be occurring abundantly in areas away from the reintroduction sites (Wydeven and Ashbrenner 1994, Wydeven and Megown 1996, Wydeven and Boles 1998).

The Gray Wolf is the only Wisconsin mammal listed as endangered by the federal government. It is listed as a threatened species by the state.

The Wisconsin population consists of about 250 wolves occurring in about 66 groups (Wydeven and Wiedenhoeft 2000a). Both the state and federal Gray Wolf recovery plan goals include establishing a sustainable population of 80 wolves in Wisconsin by the year 2000. In addition, the federal goals include establishing a viable population of 100 wolves outside of Minnesota and Isle Royale. In 1999, wolves were reclassified by the DNR from state endangered to threatened, and a state delisting goal of 250 was set for areas outside of Native American reservations (Wisconsin DNR 1999). If the populations of wolves remain stable or increase, federal reclassification to threatened or delisting could occur in the near future.

The Canada Lynx was previously listed as endangered by the state. It was down-listed to "special concern" in 1997, and placed on the list of protected animals (NR 10, Wis. Admin. Code). This species only occasionally occurs in Wisconsin in invasion years in the winter and there is no evidence of breeding. It is unclear if the Canada Lynx did once breed in the state and is now extirpated, or was always an occasional visitor (Thiel 1987). The DNR received three reports of Canada Lynx in 2001 (Wydeven and Wiedenhoeft 2002). The U.S. Fish and Wildlife Service listed the Canada Lynx as federally threatened in 2000, based on its range-wide status and potential threats.

The last known Mountain Lion in the state was killed in 1908 (Lewis and Craven 1987), although the species once included all of Wisconsin in its range. Mountain Lions are considered extirpated from the state, but a handful of sightings is reported annually. Fifty-eight sightings were reported between 1975 and 1987 (Lewis and Craven 1987), and many additional reports have been made since. The DNR received a total of 42 probable and possible observations of Mountain Lions in 2001 from 22 counties (Wydeven and Wiedenhoeft 2002). A large percentage of Mountain Lion reports are questionable. For example, only 6 of 39 Mountain Lion reports made in 1996 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and only 4 of 41 reports in 1997 were classified as "probable," and 1998 were classified as "probable," and 1998 were classified as "probable,"

Moose once ranged throughout northern Wisconsin as far south as northern Green Lake and Sauk Counties, but were extirpated from the state in the early part of the twentieth century (Schorger 1957, Jackson 1961). In recent years, Moose have been reported in Florence, Marinette, and Oconto counties in the Northeast, Ashland, Iron, Oneida and Price counties in the northcentral part of the state, and Rusk County in western Wisconsin. These represent stray individuals from Michigan and Minnesota populations. The appearance of calves in 1995, 1996, and 1999 suggests that some limited reproduction may be occurring in the state (Wydeven and Megown 1996, Wydeven and Cervantes 1997, Wydeven and Wiedenhoeft 2000b).

Recent Reintroductions of Rare Mammals

In addition to the active reintroduction of American Marten and Fisher (*Martes pennanti*) and the natural recolonization of the Gray Wolf, efforts have been made to establish breeding populations of two other native mammals.

A herd of 41 Elk (*Cervus elaphus*) was introduced from Yellowstone National Park to an enclosure in the Trout Lake area in 1917 (Scott 1939), but many died from pneumonia and the population did not persist. In 1932, the remaining 15 elk in this pen were released into the wild, but most died due to poaching (Jackson 1961). Elk restockings from 1930-1950 were also unsuccessful (Endangered Species Committee 1973), primarily due to poaching. An experimental Elk herd was released into the Chequamegon National Forest in May 1995. A 4-year study conducted by the University of Wisconsin-Stevens Point will help determine the feasibility of reintroducing elk into northern Wisconsin. Readers interested in learning more about the elk reintroduction effort can find information on the Wisconsin Elk Reintroduction Study's web page (http://www.uwsp.edu/wildlife/research/wers/elkpage.htm).

American Bison (*Bos bison*) once roamed the prairies throughout southern and western Wisconsin, but by 1830 were rare (Endangered Species Committee 1973) and by 1833 were extirpated from Wisconsin (Schorger 1937, Jackson 1961). Small groups of American Bison are maintained in large enclosures at the Sandhill State Wildlife Area near Babcock in Wood County and at the McKenzie Environmental Center near Poynette in Columbia County. No other "wild" populations of American Bison occur in the state.

Spilogale putorius Eastern Spotted Skunk¹⁸

¹³ There is only a single record of the federally endangered Indiana Bat (*Myotis sodalis*) from Wisconsin (Jackson 1961). Its occurrence as a breeding species is doubtful, but some biologists have suggested that the lack of modern records may be due to a lack of bat survey work in the state rather than to the absence of the species.

¹⁴ This species is also commonly referred to as the Timber Wolf, especially in areas of the state where it has re-established populations.

¹⁵ The genus name *Lutra* is still used by some writers. We feel that Koepfli and Wayne (1998) clearly demonstrated that otters of the *Lutra* and *Lontra* groups do not share an exclusive common ancestor and therefore follow Jones, *et al.* (1997) in using *Lontra*.

An unknown number of the non-native Beech Marten (*Martes foina*; also referred to as the Stone Marten) were released from a fur farm and are now established in and around the southern unit of the Kettle Moraine State Forest (Jefferson, Racine, Waukesha, and Walworth counties) (R. Bautz, pers. comm.; Long 1995). The size of the population and whether or not it is reproducing is unknown. Documentation of the species is limited. A single specimen, a tanned skin, is available in the University of Wisconsin Zoology Museum (R. Bautz, pers. comm.), and a mounted specimen is displayed at the Kettle Moraine State Forest headquarters (Long 1995).

Family Erethizontidae: New World Porcupines

Erethizon dorsatum Common Porcupine

¹⁹ Older works divide these rodents into a New World family (Cricetidae) and an Old World family (Muridae). Morphological differences between the two groups are minor. Most mammalogists currently emphasize the similarities by grouping them together as we have.

¹⁷ Skunks were previously included with weasels in the family Mustelidae, but recent phylogenetic work using analyses of mitochondrial-DNA sequence data and morphological data (Dragoo and Honeycutt 1997) resulted in skunks being grouped together in the new family Mephitidae.

¹⁸ There are only a few historical records of Spotted Skunks (*Spilogale putorius*) from Wisconsin. Its occurrence as a breeding species is doubtful, but some biologists suggest the lack of modern records may be due to a lack of recent field survey work rather than the absence of the species.

²⁰ Placement of American Bison into the genus *Bos* has been somewhat controversial. Several authors (Groves 1981, Miyamoto, *et al.* 1989, Wall. *et al.* 1992) provide data to support the placement of *Bison* in synonymy with *Bos*, yet relatively few references have embraced this change (e.g., Nowak [1999] and Wilson and Ruff [1999] retain *Bison*). We feel that the evidence is so compelling that we follow Jones, *et al.* (1997) and Forsyth (1999) and use *Bos*.

APPENDIX A. Legal Designations

In addition to the conservation status designations (endangered, threatened, etc.) identified in the Introduction (page 2), Wisconsin law provides legal definitions for several groups of vertebrate animals. Terms such as "game animal," "panfish," "fur-bearer," and "migratory game bird" often come up in resource management and outdoor recreation discussions. Some of these terms have specific legal meanings. Definitions for these terms, as they appear in the state statutes and administrative rules, are listed here for reference purposes. The statutes and administrative rules rarely include scientific names and often group species together under a single term (e.g., "fox" would include both red and gray foxes).

Definitions Applied to Fishes

Bait means any species of frog, crayfish or minnow used for fishing purposes. (§ 29.509(1), *Wis. Stats.*).

Farm-raised fish means a fish that is kept on a fish farm for propagation purposes or reared on a fish farm and that has not been introduced, stocked or planted into waters outside a fish farm or that has not escaped from a fish farm. (§ 29.001(25), *Wis. Stats.*).

Game fish includes all varieties of fish except rough fish and minnows. (§ 29.001(41), *Wis. Stats.*).

Minnow includes a sucker not listed as endangered or threatened under s. 29.604(3), central mudminnow, tadpole madtom, stonecat, banded killifish, blackstripe topminnow, brook silverside, brook stickleback, ninespine stickleback, troutperch, darter, log perch, sculpin. "Minnow" includes any minnow family cyprinid that is not listed as endangered or threatened under s. 29.604(3) and that is not a goldfish, grass carp, common carp or rudd. "Minnow" does not include any sucker, darter, sculpin or minnow species that is designated detrimental under s. 29.424. (§ 29.001(54), *Wis. Stats.*).

Panfish means the following fish species: yellow perch, bluegill, black crappie, white crappie, pumpkinseed, green sunfish, warmouth and orangespotted sunfish. (§ NR 20.03(29), Wis. Admin. Code).

Rough fish includes suckers, not listed as endangered or threatened under s. 29.604(3), common carp, goldfish, freshwater drum, burbot, bowfin, garfish, sea lamprey, alewife, gizzard shad, rainbow smelt and mooneye. (§ 29.001(74), *Wis. Stats.*).

Definitions Applied to Birds

Eyas means a young raptor not yet capable of flight. (§ NR 18.01(3), Wis. Admin. Code).

Game birds includes wild geese, brant, wild ducks, wild swan, rails, coots, gallinules, snipe, woodcock, plovers, sandpipers, ruffed grouse, prairie chicken, sharptailed grouse, pheasants, Hungarian partridge, Chukar partridge, bobwhite, quail, crows and wild turkey. (§ 29.001(39), *Wis. Stats.*).

Migratory game birds means any bird which is migratory and on which an open season has been prescribed in this chapter [NR 10, Wis. Admin. Code] and belonging to one of the following families: (a) Anatidae (wild ducks, geese and brant), (b) Rallidae (rails, coots and gallinules), (c) Scolopacidae (woodcock and Wilson's snipe (jacksnipe)). (§ NR 10.001(15), Wis. Admin. Code).

- **Raptor** means a live, migratory bird of the order Falconiformes or the order Strigiformes, other than a bald eagle (*Haliaeetus leucocephalus*) or golden eagle (*Aquila chrysaetos*). (§ NR 18.01(10), Wis. Admin. Code).
- **Upland game birds** are pheasants, quail, Hungarian (gray) partridge, grouse and wild turkey. (§ NR 1.14, Wis. Admin. Code).
- **Waterfowl** means any migratory bird of the family Anatidae (wild ducks, geese, brant and swans). (§ NR 10.001(30), Wis. Admin. Code; § NR 16.001(7), Wis. Admin. Code).

Definitions Applied to Mammals

- **Big game mammals** in Wisconsin are white-tailed deer and black bear. (§ NR 1.15, Wis. Admin. Code).
- **Fur-bearing animals** includes otter, beaver, mink, muskrat, marten, fisher, skunk, raccoon, fox, weasel, opossum, badger, wolf, coyote, bobcat, cougar and lynx. (§ 29.001(30), *Wis. Stats.*).
- **Fur-bearers** are muskrat, mink, weasel, beaver, otter, skunk, raccoon, fox, coyote, bobcat and opossum. (§ NR 1.16, Wis. Admin. Code).
- **Game animals** includes deer, moose, elk, bear, rabbits, squirrels, fox and raccoon. (§ 29.001(36), *Wis. Stats.*).
- **Small game mammals** include rabbits, hares and squirrels. (§ NR 1.13, Wis. Admin. Code).

Definitions Applied to More than One Vertebrate Group

- **Game** includes all varieties of wild mammals or birds. (§ 29.001(33), Wis. Stats.).
- **Nongame species** means any species of wild animal not classified as a game fish, game animal, game bird or fur-bearing animal. (§ 29.001(60), *Wis. Stats.*).
- **Protected wild animals** means those animals for which a closed season, bag limit, size limit or possession limit has been provided by statute or administrative rule, and includes: (a) Nongame species unless specifically designated as unprotected by the department [DNR]; (b) Game fish, game animals, game birds and fur-bearing animals during closed seasons; (c) endangered and threatened species listed in ch. NR 27. (§ NR 19.001(14), Wis. Admin. Code).
- **Unprotected wild animals** means those animals for which no closed season, bag limit, size limit of possession limit has been established by statute or administrative rule. ((§ NR 19.001(17), Wis. Admin. Code).
- **Wild animal** means any mammal, bird, fish, or other creature of a wild nature endowed with sensation and the power of voluntary motion. (§ 29.001(90), *Wis. Stats.*; § NR 16.001(8), Wis. Admin. Code; § NR 19.001(19), Wis. Admin. Code).
- **Wildlife** means birds and mammals, which have inhabited and were propagated in a natural environment. (§ NR 1.18(1)(c), Wis. Admin. Code).

Acknowledgments

This checklist project was completed in support of Wisconsin's Aquatic and Terrestrial Resources Inventory (ATRI). ATRI is a public and private partnership to gather, link, and make available data used for decisions affecting Wisconsin's landscape. For more information about ATRI, readers can consult the DNR web site (http://www.dnr.state.wi.us/).

We thank the following individuals for their critical review of earlier drafts of our manuscript: G.A. Bartelt, R.A. Bautz, G.S. Casper, S.R. Craven, N. Cutright, D.M. Fago, R.W. Hay, C.A. Long, J. Lyons, R.D. Mooi, M.J. Mossman, D. Neu, C. Phillps, R.E. Rolley, K.J. Scheidegger, J. Trick, W.K. Volkert, and A.P. Wydeven. We appreciate their assistance. In undertaking any taxonomic endeavor, controversial nomenclature decisions will inevitably be made. Similarly, decisions about inclusion and exclusion must be made. That was certainly the case in developing these checklists. While the above listed reviewers provided comments that were both thoughtful and helpful, we occasionally disagreed with a suggestion or made a decision contrary to one of their arguments. We take full credit and/or blame for these decisions.
